

Held out: pool/fit = images [0:10000], test = [10000:11000], k and τ picked on the last 200 images. U-nets: same SongUNet; hollow = $\sigma < 0.001$ (below training range). train = eval: pool images [0:1000], pool contains each.

Linear (Wiener) Softmax, global — held out Softmax, local — Kamb & Ganguli LS U-net, all images, 50k steps (test seen)

Softmax, global — train = eval Softmax, local — Lukoianov (Wiener mask) U-net, 10k = the pool, held out

Lukoianov at $\sigma \leq 0.001 \rightarrow 0$ is an 8-bit artefact: as $\sigma \rightarrow 0$ its Wiener mask shrinks to the diagonal, a per-coordinate nearest value among 10k training pixels, which snaps to the exact $1/255$ level once $\sigma \ll 1/255$.
